

* Lab - 04:

DATE: 15/10/24 PAGE: 18

* Iterative developing search algorithm A* Algorithm for 8 puzzle

1. Initialize

- * start with the initial state of puzzle
- * set the goal state

2. Queue :-

To store the state of puzzle

$$f(n) = g(n) + h(n)$$

$g(n)$:- is the no. of moves taken from start
 $h(n)$ - misplaced tile which count how many
 tiles are not in their goal positions

3. States :

- If the goal state is achieved then return goal state achieved
- If the goal state not achieved then given all the possible move

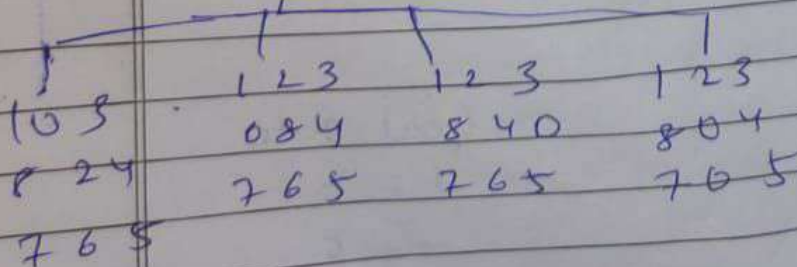

4. continue / repeat until the goal state is reached

Initial state

$$\begin{bmatrix} 1 & 2 & 3 \\ 8 & & 4 \\ 7 & 6 & 5 \end{bmatrix}$$

goal state

$$\begin{bmatrix} 2 & 8 & 1 \\ & 4 & 3 \\ 7 & 6 & 5 \end{bmatrix}$$

pseudocode :- A* 8 puzzle

1. Initialize priority queue with initial start.
 set $g(n) = 0$
 sets $f(n) = \text{no of misplaced tiles}$
 set $f(n) = g(n) + h(n)$
 while $ques \neq \emptyset$:
 * Remove state with smaller $f(n)$
 * If $curr\text{-}state = goal\text{-}state$
 - Ret's sol
 * Generate all the new states.
 - calculate $g(n)$, $h(n)$, $f(n)$
3. If goal reached then return the soln

Pseudocode :- A* IDFS

1. function IDFS (root, goal)
 for $d = 0$ to ∞ :
 $res = DLS(\text{root}, \text{goal}, d)$
 if $res \neq \text{NULL}$:
 return res
 return null
- function DLS (node, goal, d)
 if $d == 0$ and $node == goal$
 return node
 if $dept > 0$
 for child in node.children
 $res = DLS(\text{child}, \text{goal})$
 if $res \neq \text{NULL}$
 return result
 return null:

d = 0

return null

d = 1

return null

d = 2

return F
